

SQL Queries — Faculty Database (VIT Bhopal University)

Assume a table named Faculty(Faculty_ID, Name, Department, Salary)

Q1. Display the details of all faculty members working in the CSE department whose salary is greater than ₹60,000.

```
SELECT *  
FROM Faculty  
WHERE Department = 'CSE'  
AND Salary > 60000;
```

Q2. Calculate and display the average salary of faculty members in each department.

```
SELECT Department, AVG(Salary) AS Average_Salary  
FROM Faculty  
GROUP BY Department;
```

Q3. Display the names, departments, and salaries of the top five highest-paid faculty members.

```
SELECT Name, Department, Salary  
FROM Faculty  
ORDER BY Salary DESC  
LIMIT 5;
```

Q4. Display the names of faculty members with a salary between ₹50,000 and ₹80,000, arranged in ascending order of salary.

Note: BETWEEN is inclusive of both ₹50,000 and ₹80,000. For a strictly-between range, replace with Salary > 50000 AND Salary < 80000.

```
SELECT Name  
FROM Faculty  
WHERE Salary BETWEEN 50000 AND 80000  
ORDER BY Salary ASC;
```

Q5. Find the total number of faculty members working in each department.

```
SELECT Department, COUNT(*) AS Total_Faculty  
FROM Faculty  
GROUP BY Department;
```

Q6. Identify and display the faculty member receiving the highest salary.

Note: the subquery version below returns every faculty member tied for the highest salary, which is safer than a single-row LIMIT 1 approach if a tie exists.

```
SELECT *  
FROM Faculty  
WHERE Salary = (SELECT MAX(Salary) FROM Faculty);
```
